## Notes:

This document may undergo more revisions as we do dry runs in preparation for test week. PR Teams will have the DUST map for reference. See **documents/maps/** for this. This map technically includes the coordinates that the Rock Yard map is based on, however **those coordinates will NOT be indicative of where the LTV is**. This is intended and should not be an issue since interoperability is not an aspect of this year's challenge.

## Change Log:

1. Create initial document. -RE 3-5-26
2. Updated Last Nominal Position to Test Day Values

## LTV Search Radius Calculation Info

Upon arrival at the LTV last nominal position, teams are expected to calculate a search radius. The following data is provided to aid in that calculation. Though this data is designed to be static, keep in mind that it may change leading up to Test Week to accommodate challenge needs.

### Last Nominal Position:

Last Known X: -5839.30

Last Known Y: -10460.60

\* Note that these values in TSS are in meters

### Maximum Speed:

1.77 meters/second

### Time Between LNP and Rover entering Recover Mode:

310 seconds
